# Bonded hatchcover

## Hatchcover to restore watertight capacity

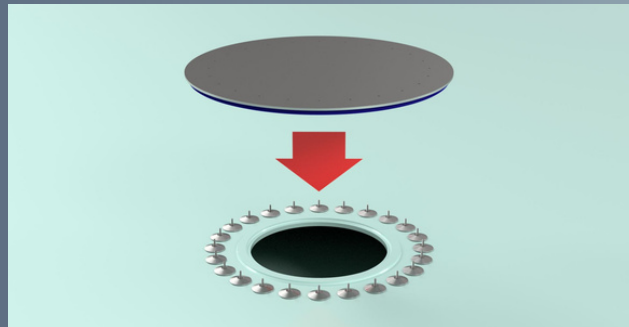

Cold Pad designed a safe and quick way to prevent water leaks into hatches and doors when they lack watertight capacities.

Based on our bonded fastener for steel **C-Claw**, our hatch cover is a non-intrusive fix which requires no hot work.

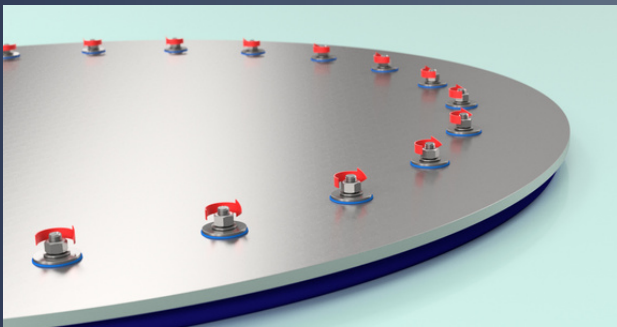

### Installation sequence :

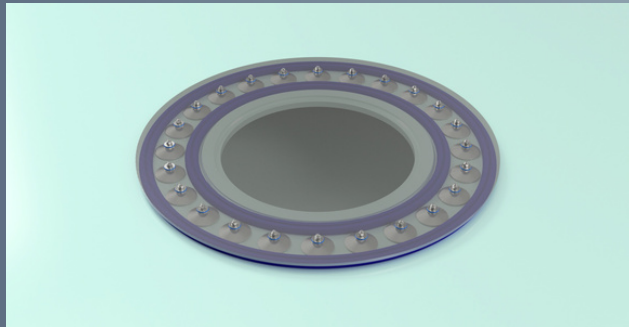

Bonding of C-Claw around the hatch

Protective plate and seal

Fastening the plate

A wathertight fix for hatches/doors

### Use case

This FPSO hatch was weathertight but not watertight, resulting in equipment above it getting wet and risking corrosion.

Cold Pad proposed a complete turnkey solution, taking care of everything from design to installation. We fixed a removable cover with bonded fasteners to protect the equipment.
